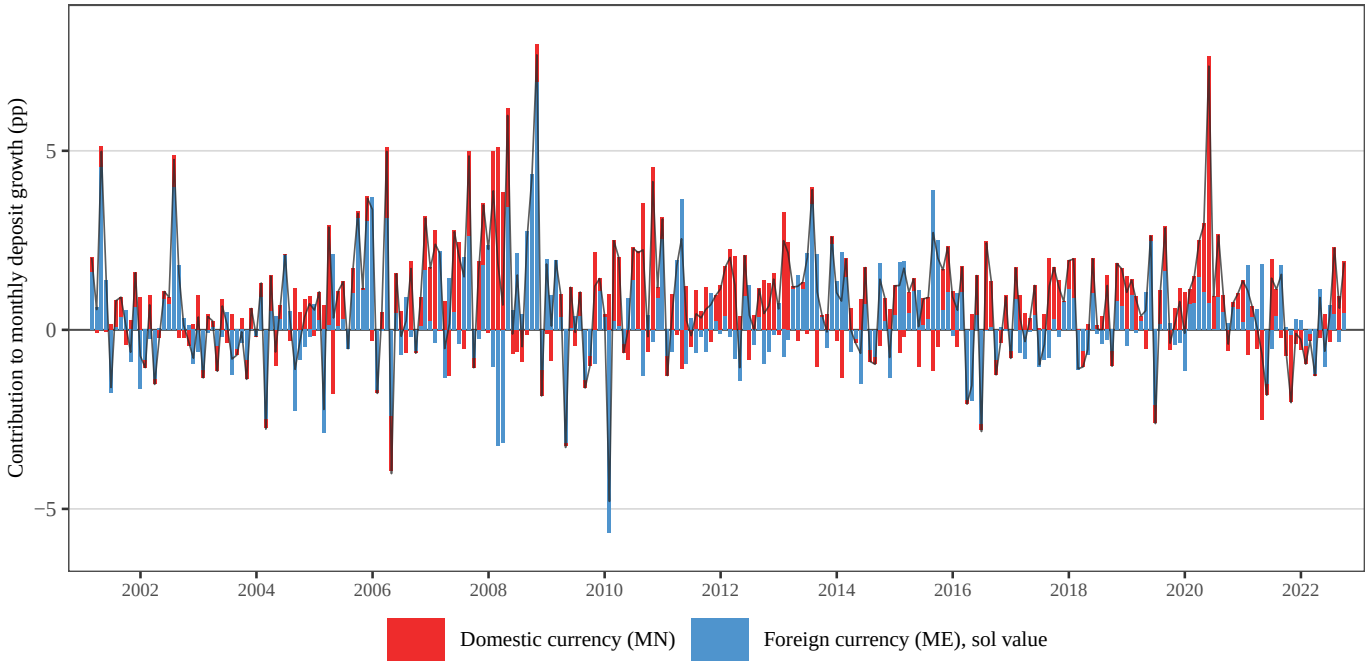
Which Currency Book Moves? Decomposition of Monthly Deposit Growth

Bars sum to total deposit growth (black line)



Source: SBS statistical series, Banca Multiple subsystem total as published, monthly Jan−2001 − Sep−2022. Contribution of each currency book to the monthly growth rate of total deposits: the change in that book divided by the previous month's total. The two bars sum to total growth (black line) by construction. This is the plot that decides whether a candidate shock is usable. The ME series is the sol value of foreign−currency deposits, so an ME−driven spike can be pure exchange−rate revaluation of an unchanged dollar stock, or a currency switch inside the same banks, neither of which is new funding. An MN−driven spike is a real sol inflow. The source reports no exchange rate, so the valuation part cannot be netted out here.
