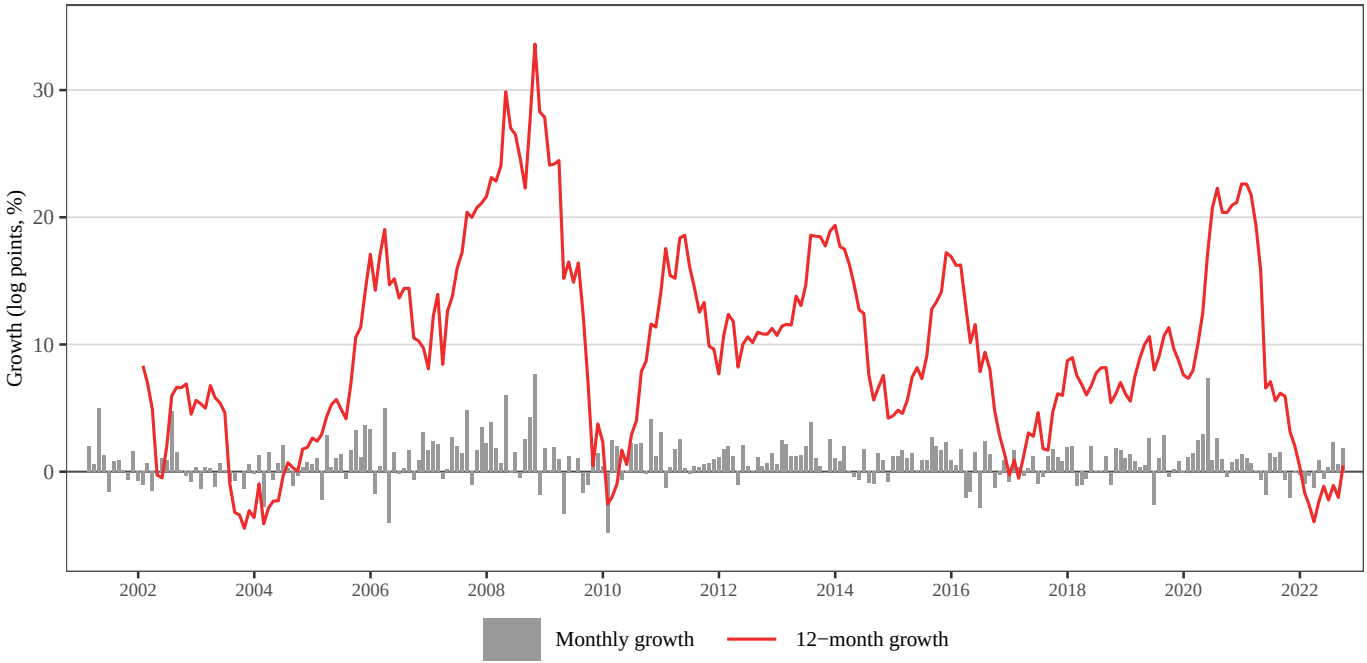
Deposit Growth, Monthly and Over Twelve Months

Bars: monthly log growth. Line: 12−month log growth. No seasonal adjustment



Source: SBS statistical series, Banca Multiple subsystem total as published, monthly Jan−2001 − Sep−2022. Bars are 100 x the monthly change in log deposits; the line is 100 x the change in log deposits over twelve months. Both are raw −− no seasonal adjustment is applied. The 12−month difference nets out any fixed calendar−month pattern on its own, and the calendar−month pattern in these data is weak in any case (the spread of calendar−month means is well inside the month−to−month noise). Read the two together: a bar that leaves no mark on the line was reversed within the year and is a level blip rather than a persistent funding shift. Average monthly growth is 0.82%, so the series drifts up and a shock means a large deviation from that drift, not merely a positive month.
